.NET, C#, REST, WCF

SQL Server

ASP.NET, GOOGLE MAPS API

LEGACY COM

Our client needed to amend previously developed postcode locator software and provide more accurate and granular location of offices.

This involved updating existing postcode coverage sets in addition to being able to accurately determine the distance between a given postcode and the nearest office. The given postcode could be fully specified or be to half sector or sector level.

A particular challenge of this project was that the original locator software had been in operation for over a decade and never been previously altered.

The scope of work for this project covered customer facing websites, intranets, call centre applications and back office systems.
